PREFACE

The International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B) is an autonomous, international, philanthropic, non-profit centre for research, education, training, and clinical service. The Centre is derived from the Cholera Research Laboratory (CRL). Its aims and objectives are to undertake and promote study, research, and dissemination of knowledge in diarrhoeal diseases and the directly related subjects of nutrition and fertility, with a view to developing improved health care methods and to prevent and control diarrhoeal diseases and improve public health programmes, especially in developing countries. The ICDDR,B issues an annual report, working papers, scientific reports, special publications, monographs, theses, dissertations, and a bi-monthly newsletter which demonstrates the type of research activities currently in progress. The views expressed in these publications are those of the authors, and do not necessarily represent the views of the ICDDR,B.

ACKNOWLEDGEMENTS

From 1984 through 1989 the Demographic Surveillance System of the International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B) was supported by the Canadian International Development Agency (CIDA). It was supported in 1990 by the Government of the Netherlands and CIDA, and in 1991-92 by the Netherlands, UNDP, and UNFPA. The ICDDR,B is supported by countries and agencies which share its concern for the health problems of developing countries. Current donors include: the aid agencies of the Governments of Australia, Bangladesh, Belgium, Canada, Denmark, Japan, the Netherlands, Norway, Saudi Arabia, Sweden, Switzerland, the United Kingdom, and the United States; international organizations including the United Nations Children's Fund, the United Nations Development Programme, the United Nations Population Fund, and the World Health Organization; and private foundations including the Ford Foundation and the Sasakawa Foundation.

The ICDDR,B is grateful to the British Overseas Development Administration for the generous grant which funded the completion of this report, including the provision of the services of Dr. John Blacker, who improved the content and accuracy of this report and its rapid finalization.

SUMMARY

This report presents the vital registration data for events taking place in 1988 in Matlab, Bangladesh. These data were collected by the Demographic Surveillance System of the International Centre for Diarrhoeal Disease Research, Bangladesh. The surveillance area is divided into a Maternal and Child Health and Family Planning (MCH-FP) intervention area and a Comparison area receiving government services.

In 1988 fertility continued to fall in the MCH-FP area; the crude birth rate declined to 30.9 per thousand and the total fertility rate to 3.8 births per woman; but no such decline occurred in the Comparison area, where the crude birth rate rose slightly to 40.4 per thousand and the TFR remained unchanged at 5.4.

Mortality also continued to fall in the MCH-FP area, with the crude death rate dropping to 8.7 per thousand and the under-five mortality to 107.4 deaths in the first five years of life per 1000 live births. Most of this decline was due to changes in the mortality rate of children aged 1-4 years; infant mortality in fact increased slightly in the MCH-FP area from 78.4 to 80.8 per thousand live births. In the Comparison area there was little change in the level of mortality: the crude death rate remained at 11.0 per thousand, compared with 11.2 in 1987, and the under-five mortality rate also remained virtually constant at 146.1 per thousand, compared with 145.2 in 1987.

Rates of both in- and out-migration for the surveillance area as a whole declined on 1987, being 26.5 for in-migrants and 41.5 for out-migrants, leaving a net out-migration of 15.0 per thousand. This net loss therefore tends to offset the rate of natural increase of 25.6 per thousand, and reduces the overall rate of population growth to little more than 1% per annum.

CHAPTER 1

INTRODUCTION

Since 1963 the International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B), formerly the Cholera Research Laboratory, has been conducting a health related research programme near the town of Matlab, in rural Bangladesh. Matlab is located about 55 kilometers southeast of the country's capital, Dhaka (Figure 1.1). The Demographic Surveillance System (DSS) is one of the components of this field programme. Since 1966 the DSS has maintained the registration of births, deaths, and migrations, in addition to carrying out occasional censuses. In 1975 the system was augmented to include marriages and divorces. Such information is gathered by Health Assistants who visit each household in their assigned areas regularly and fill out the event registration forms. A detailed description of the DSS and its operation appears in CRL Scientific Report No. 9 (March 1978). In October 1977 the surveillance area was reduced from 233 to 149 villages and a Maternal Child Health and Family Planning (MCH-FP) Programme was begun in 70 villages. The remaining 79 villages were treated as a Comparison area (Figure 1.2). These changes are described in detail in the ICDDR,B Scientific Report No. 47 (May 1981).

This is the nineteenth volume of a series of scientific reports of the Demographic Surveillance System produced by the ICDDR,B. Presented here are results obtained from the Matlab DSS in 1988, along with brief notes and explanations of the tables.

CHAPTER 2

POPULATION CHANGES

Table 2.1 summarizes the principal vital statistics of the MCH-FP and Comparison Areas from 1978 up to 1988. The figures for 1988 show that fertility in the MCH-FP area continued to decline, with the crude birth rate dropping to 30.9 per thousand and the total fertility rate to 3.8. In contrast, the Comparison area shows no consistent decline in fertility: the 1988 crude birth rate in fact shows a slight rise on that of 1987, and is indeed marginally higher than it had been ten years earlier at the beginning of the MCH-FP project.

Under-five mortality also showed a significant decline in the MCH-FP area in 1988, which was entirely attributable to the fall in the mortality of the 1-4 age group, since the infant mortality rate rose slightly on the 1987 figure. The Comparison area showed no decline in either infant or under-five mortality in 1988 compared with the previous year. Both areas had experienced increases in infant and child mortality in the early 1980's, which reached a peak in 1984; this was followed a sharp fall in 1985, which was continued in 1986 and 1987.

The trends in total fertility and under-five mortality, 1978-1988, are illustrated in Figure 2.1.

Migration rates, both in and out of the study area, continued at much the same level as in the preceding years, and resulted in a net loss of migrants which constituted about 1.5% of the population. This loss tends to offset the rate of natural increase, currently 25.7 per thousand, or 2.57 per cent, in 1988 for the two areas combined. Thus the overall rate of population growth was just over 1 per cent per annum.

Tables 2.3 to 2.5 show the age and sex distributions of the whole study population, of the MCH-FP and Comparison areas, and of the four blocks which constitute the MCH-FP area. The fall in fertility in the MCH-FP area is reflected in changes in the age distribution. Comparing the 1988 percentage age distribution with that of 1978 shows that the proportion under the age of 15 had fallen from 43.4% in 1978 to 39.8% in 1988. In contrast, the age distribution of the Comparison area shows relatively little change, the proportion under 15 being 43.3% in 1978 and 42.4% in 1988. Figure 2.2 shows the 1988 age-sex pyramid.

Figure 2.2: Age Pyramid of the 1988 Mid-year Population

CHAPTER 3

MORTALITY

Tables 3.1 to 3.3 show the distribution of deaths by sex and age for the whole study area, for the MCH-FP and Comparison areas; and for the four blocks of the MCH-FP area; Tables 3.4 and 3.5 show the corresponding age-sex-specific mortality rates for the study area and for the MCH-FP and Comparison areas; and Tables 3.6 to 3.10 the abridged life tables derived from these rates.

The most important feature of these results (already noted briefly in Chapter 2) is the decline in the mortality of the 1-4 age group in the MCH-FP area. The mortality rate in this age group had declined steadily over the preceding four years, so that the 1988 rate was less than one-third of that of the peak rate in 1984. The figures for the Comparison area also show a steady decline in child mortality, but less dramatic than that in the MCH-FP area, and the 1988 rate for males in fact showed a slight increase on that of 1987. In both areas female child mortality was half as high again as male.

The decline in the 1-4 child mortality provides a contrast to the trend in that of infants under 1, which had shown little change in 1986, 1987 and 1988 in both the MCH-FP and the Comparison areas. This plateau appears to be a feature of both the neonatal and post-neonatal rates. Male mortality tends to be slightly higher in the first month of life, after which female mortality is higher.

Adult mortality can conveniently be summarized by the probability of dying between the ages of 15 and 60, sometimes denoted as 45Q15 (Feachem et al. 1992). This index can be readily calculated from the life tables shown in Tables 3.6 to 3.10. The results (expressed per 1000 persons reaching age 15) are:

	Both sexes	Males	Females
Both areas	195.1	211.2	178.4
MCH-FP area	199.4	220.4	177.2
Comparison area	190.4	201.4	179.7

There appears to be little difference between the MCH-FP and Comparison areas, and in both areas male mortality is higher than female. When compared with the corresponding figures for 1987, these rates suggest a small decline for both sexes in the Comparison areas and for males in the MCH-FP, but the female rate in the latter appeared to have risen.

Table 3.11 shows the distribution of deaths by age and month. Deaths peaked in November, December, and January, which appears to be a regular feature of Bangladesh mortality, though it is one which is characteristic of adults rather than children; for whom the seasonal fluctuations are less regular.

Tables 3.12 to 3.15 show the distribution of deaths by age, sex, and cause. These data are summarized in Table 3.16, which shows the age-standardized mortality rates by cause. The standard age distribution used for the calculation of these rates was the "World standard" used by the World Health Organization when presenting such rates in their Statistics Annual (WHO 1992). It will be seen in Table 3.16 that the mortality rates from diarrhoea, dysentery, ARI, neonatal tetanus, and "other neonatal" causes were consistently lower, for both sexes, in the MCH-FP area than in the Comparison area. Since these are the major causes of death in infancy and childhood, the differentials so revealed help to explain why under five mortality has been consistently lower in the MCH-FP than in the Comparison area.

CHAPTER 4

FERTILITY

Table 4.1 shows the number of pregnancies and their outcomes in 1988. When compared with the corresponding figures for 1987, the number of both pregnancies and live births in the MCH-FP area declined, while those in the Comparison area increased. The proportion of foetal losses declined slightly in both areas. Miscarriages are defined as foetal losses of less than seven months gestation, while those occurring at seven months or more are designated as stillbirths.

Table 4.2 and Figure 4.1 show the distribution of births by month of occurrence. They show the same marked seasonal fluctuations found in previous years, with a pronounced peak in October and November.

Tables 4.3 and 4.4 show the age-specific and total fertility, gross and net reproduction rates. The age-specific fertility rates in the MCH-FP area were lower than those in the Comparison area at all ages except 45-49, the greatest relative difference being between the ages of 30 and 45, where the MCH-FP rates were some 40% lower than the Comparison area rates. When MCH-FP rates are compared with those for 1987, declines are apparent for all ages except 20-24, the greatest relative fall being in the 35-39 age group, which dropped by 32%. In contrast the rates for the Comparison area increased at all ages except 35-39 and 45-49.

Table 4.5 shows the age-specific fertility rates for the four blocks of the MCH-FP area. Comparing with the corresponding data for 1987 shows that fertility fell in Blocks A, B and C, but in Block D the TFR remained virtually constant. However even here the fertility rates for women between the ages of 30 and 45 fell appreciably.

Table 4.1: Number and Rates of Pregnancy Outcomes by Type and Area, 1988

Type of pregnancy outcome	Both areas		MCH-FP area		Comparison area

CHAPTER 5

MARRIAGE AND DIVORCE

The number of marriages registered in 1988 was 2540, which was about 11% fewer than in 1987, and about 17% less than in 1978, the first year of the study. Thus the crude marriage rates have fallen from 17.6 per thousand in 1978 to 14.4 per thousand in 1987 and 12.7 per thousand in 1988. However, the decline in the number of marriages does not imply a change in the age patterns of marriage. Tables 5.1 and 5.2 show the distributions of grooms and brides by age. The median age of brides marrying for the first time was 18.0 years, which differed insignificantly from the 1987 figure of 18.3, or indeed from the 1978 figure of 17.5.

The number of divorces, shown in Table 5.5 by partners' ages, was 420, which was also a drop on the previous year's total of 482, and on the 1978 figure of 514.

Tables 5.6 and Figure 5.1 show the distribution of marriages and divorces by month. The numbers fluctuate erratically from month to month, and the comparison of the data with previous years does not suggest a regular seasonal pattern.

CHAPTER 6

MIGRATION

An "out-migrant" is defined as a person originally listed on a DSS census as a resident, or a person who became a resident after the census by birth or immigration, who subsequently moved out of the surveillance (DSS) area permanently. Likewise, an "in-migrant" is an individual not recorded in the census who has permanently moved into the surveillance area. Those who stay in the area continuously for at least six months in a year or come home at least once a month to stay overnight are treated as permanent residents. It may be noted that these definitions refer to the surveillance areas as a whole. People who move from the Comparison area into the MCH-FP area, or vice versa, do not feature in the tables which show the numbers of migrants in the two areas.

The number of in-migrants in 1988 was 5,294, giving a crude rate of in-migration of 26.5 per thousand. These figures constitute a drop of over 20% on the 1987 figures, but since the latter were abnormally high and were the largest recorded since the start of the study, the 1988 figures represent a return to a more normal level of in-migration. The number of out-migrants, 8,306 in 1988, also showed a drop on that of 1987, which had likewise been a peak year in this respect.

The numbers of in-migrants were more or less evenly divided between the MCH-FP area and the Comparison area, but a rather larger number of out-migrants left from the Comparison areas, as shown in Table 6.3.

Table 6.4 shows the age-sex-specific migration rates, which are illustrated in Figure 6.1. They show the bi-modal distributions commonly found for migrant populations, with a primary peak of young adults (20-34 for males; 15-24 for females) and a secondary peak of young children moving with their parents.

Table 6.9 and Figure 6.2 show numbers moving in and out by month. As in previous years, January appears to be the preferred month for making such moves.

Appendix C
Life Table Equations

$$1. \quad {}_nq_x = \frac{{}_n m_x}{\frac{1}{n} + {}_n m_x [\frac{1}{2} + \frac{n}{12}({}_n m_x - \ln C)]}$$

$$2. \quad l_0 = 100,000$$

$$l_x = (1 - {}_n q_{x-n}) l_{x-n}$$

$$3. \quad L_0 = 0.276l_0 + 0.724l_1$$

$$L_1 = 0.410l_1 + 0.590l_2$$

$$L_i = \frac{1}{2}(l_i + l_{i+1}), \quad i = 2, 3, 4$$

$${}_n L_x = \frac{{}_n d_x}{{}_n m_x} \text{ for } 5 \leq x \leq 80$$

$${}_\infty L_{85} = \frac{l_{85}}{\infty m_{85}} \text{ for the last age group 85+}$$

$$4. \quad e_x = \frac{T_x}{l_x} \text{ where } T_x = \sum_{y=x}^{\infty} {}_\infty L_y$$

Note: Greville's method, as suggested in Shryock, H.S., Seigel, J.S., and Associates, The Methods and Materials of Demography (revised), U.S. Dept. of Commerce, Bureau of the Census, 1975, Vol. II p.414 and pp. 444-5.

($\ln C$ assumed to be 0.095; separation factors in Equation 3 correspond to an infant mortality rate of 100.)

Hospital Endowment Fund

Each year, ICDDR,B treats over 70,000 patients attending its two hospitals, one in urban Dhaka, the other in rural Matlab. Though they are planted in Bangladeshi soil, they grow because of the dedication of thousands of concerned people throughout the world. The patients are mostly children with diarrhoea and associated illnesses and the services are offered free to the poorer section of the community.

Since these services are entirely dependent on financial support from a number of donors, now we at the ICDDR,B are establishing an entirely new endeavour: an ENDOWMENT FUND. We feel that, given securely implanted roots, the future of the hospitals can confidently depend upon the harvest of fruit from perpetually bearing vines.

To generate enough income to cover most of the patient costs of the hospitals, the fund will need about five million dollars. That's a lot of money, but look at it this way:

JUST \$150 IN THE FUND WILL COVER THE COST OF TREATMENT FOR ONE CHILD EVERY YEAR FOREVER!

We hope you will come forward with your contribution so that we can keep this effort growing forever or until the world is free of life-threatening diarrhoea. IT IS NOT AN IMPOSSIBLE GOAL.

Cheques may be made out to: ICDDR,B Hospital Endowment Fund.

For more information please call or write to:
Chairman, Hospital Endowment Fund Committee
GPO Box 128 - Dhaka, 1000, Bangladesh

Telephone: 600-171 through 600-178
Fax: (800) 21-883-116

Designed and Produced by Asim Aziz/Audio-Visual Unit, ICDDR,B

My contribution to the Hospital endowment Fund is enclosed. Amount _____
